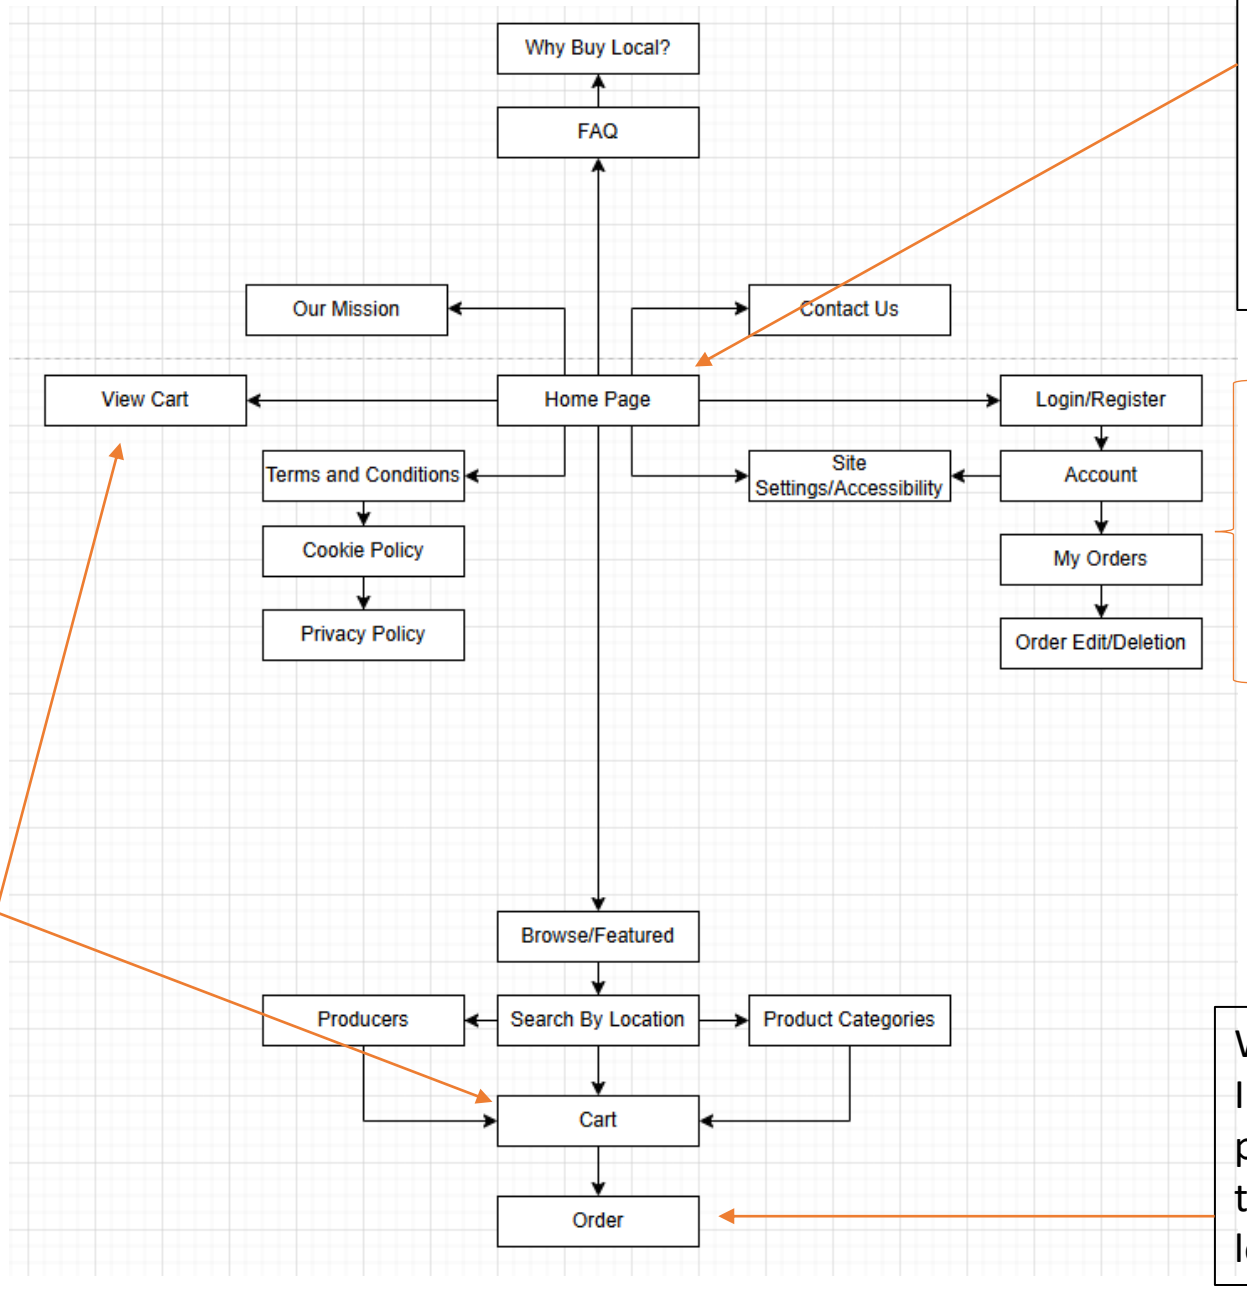
Visual Designs and Annotations

Nathan Share

Sitemap – Greenfield Local Hub

For my sitemap, I decided to focus on a central homepage that branches out into several key sections of the site. The benefit of organising it this way is that related information remains together and simple to find, and it gives users who are new to the site a clear sense of grouped direction.

Any pages above the central Homepage (besides Contact Us) Are the static pages, or pages that do not require interaction from the database. I kept these up here to easily visually segment the two kinds of page and distinguish between them at a glance.



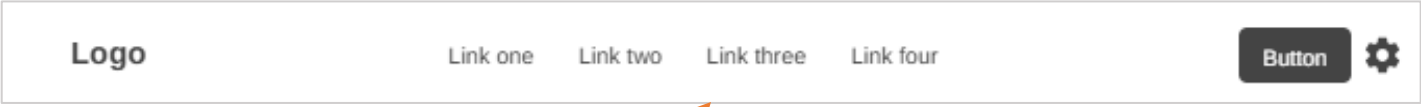
On the far right side of the sitemap is all of the pages that are individualised to the user. These include order editing and deletion, account pages, site settings, account information pages and login or registry. This is also to visually layout and distinguish different aspects of the site.

Furthermore, I have added the cart page twice, once from the homepage, where the user can access it as a shortcut, and once before ordering, as a natural segue into the payment/order process.

While this can slightly hinder navigation, I have chosen to keep even the furthest pages at a maximum of 4-5 clicks from the homepage, so that it is difficult to lose the page you're looking for.

Wireframe – Headers and Footers

Site Link



For the header navbar, I chose to go for an industry standard style bar, with space for all buttons to adapt depending on screen size. The Logo (placed on the left) will also function as a shortcut to the Homepage of the site, as is the case with most similar website styles.
On the right will be the buttons for both registering and/or logging in, and accessibility settings.

These settings will be able to be edited regardless of login status, allowing all users to have the best experience on the site regardless of their registered user status.

Both the Navbar and the Accessibility menu (which I will have as a pop-up that appears when clicking the button) will use the standard font for the website, Tahoma, at a font size of 14-16 at default.

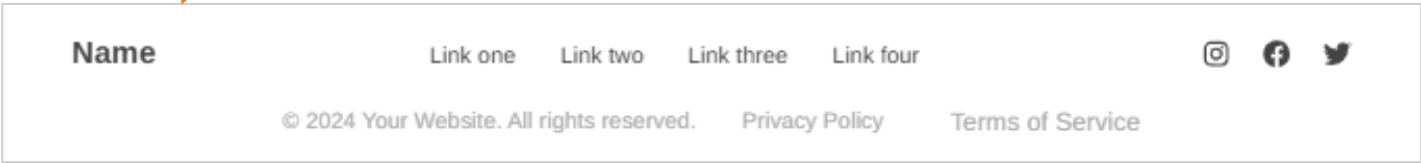
The background of the navbar will be in a parchment beige (#F1E9D2) colour, with all buttons having a deep green (#0A760D) background with white text to stand out.

As for the footer bar, I also chose to use an industry standard style of bar. This includes the company name, links to legal pages such as Privacy and Terms of Service, and will further include links to other pages (FAQ, Contact Us) as well as social media links for the client to integrate themselves.

Both the header and footer bar will be integrated into every page to offer sitewide consistency whilst allowing the user to never be more than a few clicks from their desired page.

I have chosen the designs to look this way as it adds clear framing to each page to clearly define where each page starts and ends, assisting navigation for newer or less skilled users.

The font of the footer will match the style and side of the header bar, but the colour scheme will be reversed to be a green background with beige buttons and black text, to differentiate the two bars from one another.

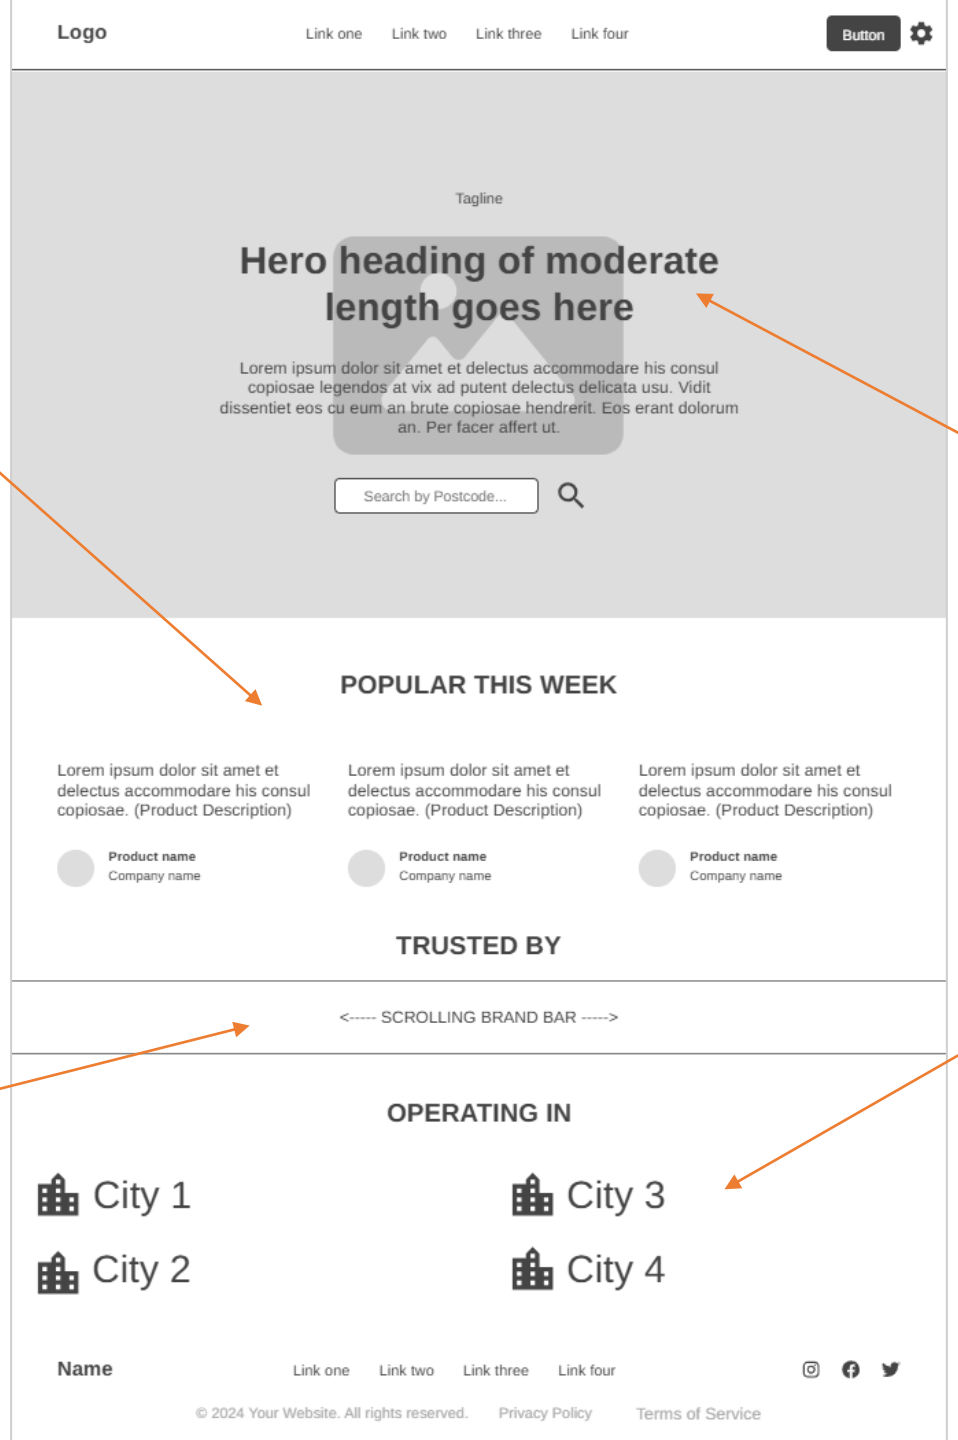


Wireframe – Homepage/Index Page

Site Link

Following up from the tagline and search bar is the "Popular this week" section, which will include a show of several products, along with a description of what they are and who is selling them. This selection could rotate through either random products or best-sellers of that time period, allowing a user to see what the general audience of the site is buying often. This gives potential sellers a way to see what trends are currently happening in the sales, and potential buyers a clear sight of what is worth buying. The heading text here would be in Garamond at a size 18-20, and the main body including the product and seller names and descriptions would be in Tahoma at a size 14. All text would be black and on a white background, or in a greyscale reverse scheme should the user choose Dark mode.

Below the Popular section is the "Trusted By" scroller, which would offer the names and/or logos of sellers or companies that sell their products on the site, should their consent have been given. This would offer a long scrollbar that would show the average user just how much variety is offered by the client and how many other people trust them. Heading and body text here would follow the same formatting as the section above.



For the homepage, I tried to focus on the fact that this is a hooking page, meant to catch a new user's attention and sell the service to them in less than a minute or so. To do this, I opened the site with a large, bold-text tagline which will jump out at a prospective user, as was seen to be used effectively in my research. This is followed by a smaller, more elaborate description of the client's goal, followed by a postcode search bar. This is the first thing visible even prior to user input, so it has to involve large designs. The tagline text will be in the font of Garamond in the font size of 50 and in the beige colour of #F1E9D2, large enough to be read at a glance, and standing out against the darker green-hued image background of #053506, a little darker than the green of the navbar buttons, and the following description will be in Tahoma at a font size of 16, as will the search bar text.

Finally, rounding out the homepage of the site is the "Operating in" bar, showing all the different places that the customer could order their services from. These Towns or Cities could be chosen at random or cycle every few seconds to show a wider range of places that the client works to deliver to/from and therefore display to a potential buyer how convenient it could be to order from them.

Wireframe – My Account

Site Link

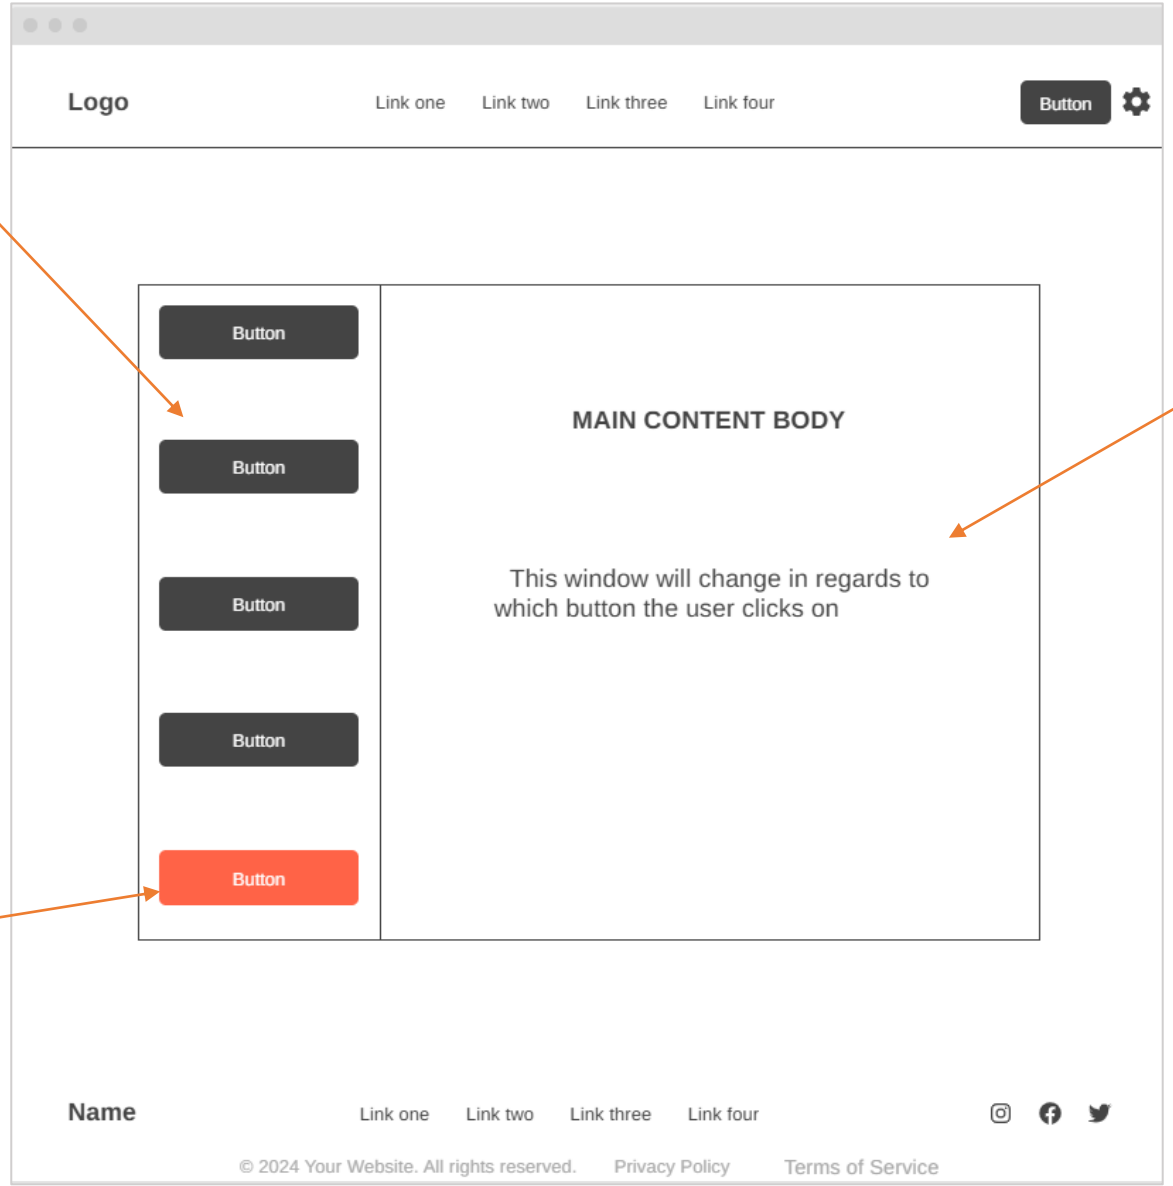
For the Login Page, I chose to take a different approach to the standard and offer a comprehensive card which changes based on which of the buttons on the left that the user selects.
All buttons would have the font of Tahoma in a font size of 14 at base.

The buttons will be a clear green, except for the bottom one, which will remain red.

The buttons would go to places like “Sign out” or “Rewards points” or “Account details”

The bottom button (Highlighted red) would lead to a “Delete Account” button, which would then go through a password entry screen and a confirmation screen before deleting the user’s details.

This button would be a stark red which stands out against any other button on the site, allowing it to stand out to the user even if they are unable to read the text, reducing the likelihood of accidental clicks that lead to general misfortune, and the colours would remain jarring no matter the user’s choice of visual style.



The “Content” tab would be the main part that changes, allowing the user t to access parts like “edit details” or similar aspects of a profile screen without having to change the major parts of the screen that they are on. This lines up with my attempt to keep as much content as easily accessible as possible, and reduces the loading stress of loading a whole new page or window. The tab may be scrollable, to allow for windows with more content than can fit in the given area.

In the main content section, any headers will use the Garamond font at a size 20, and any body text will be in Tahoma at a size 14 at base. Colours will remain black and white, with the distribution of these colours changing depending on the user’s colourblind/dark/light mode choices.

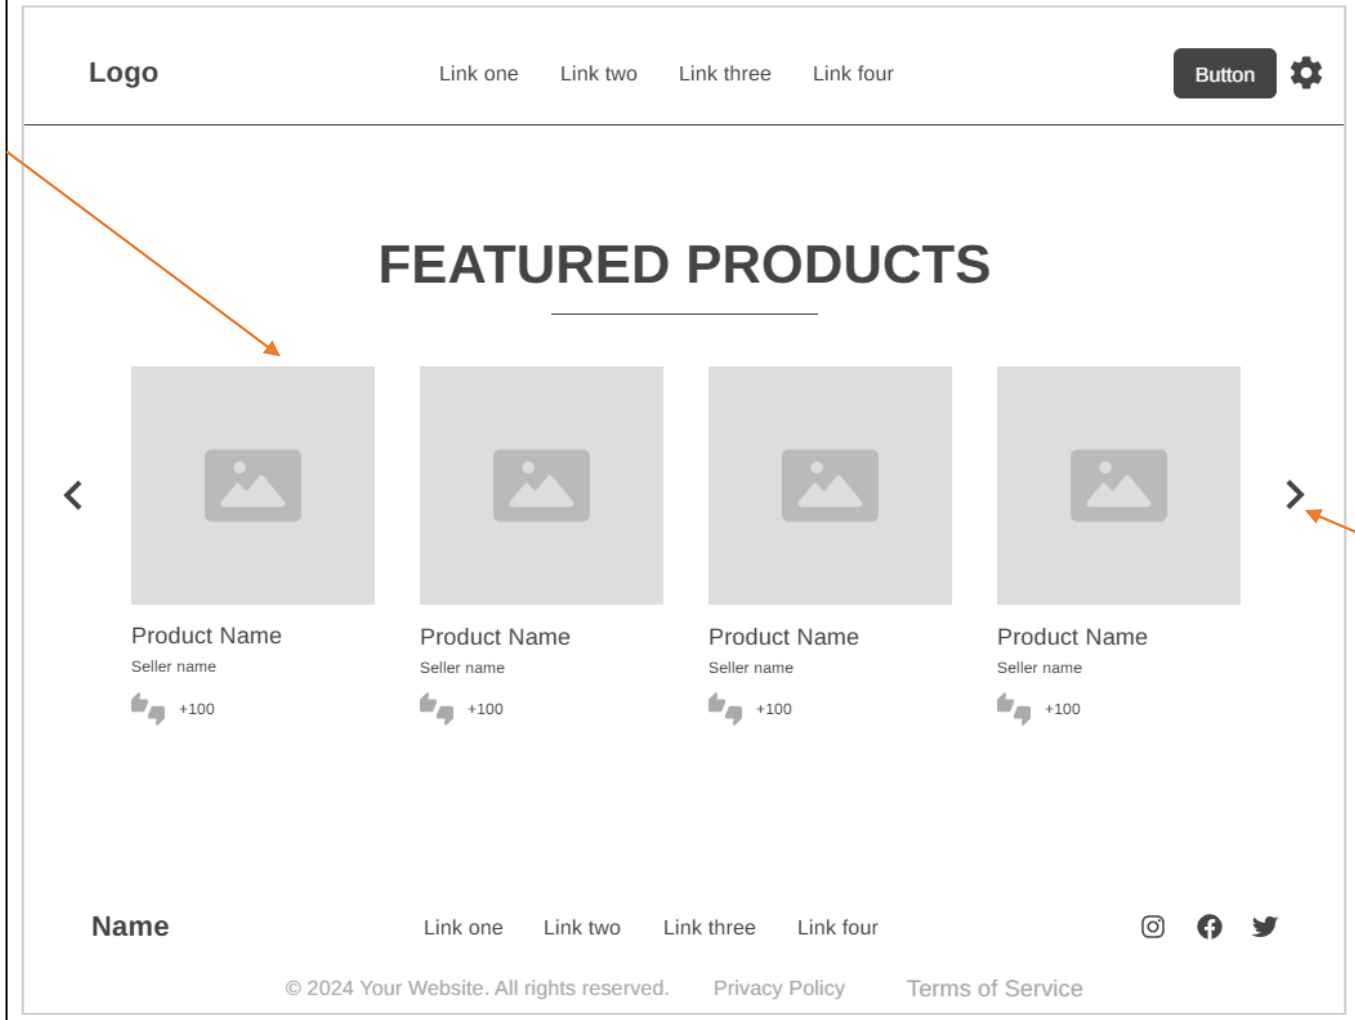
Wireframe – Featured Products

Site Link

For the Featured Products page, I chose to stay with the methodology that every product deserves considerable limelight if they are on this page. As such, I chose to give them individualised, large product showing windows that offer a like/dislike rating. Featured products would be randomly selected each week, and people who have ordered can give positive/negative votes on these products, allowing them to stay up for longer or be switched out faster, showing what the users want and like, versus what they would prefer not to see. This also offers direction to sellers as it shows them which products are likely to sell well.

For the header, I plan for the small underline to have more filigree to look more ornate, better matching the non-minimalist design I've been going for.

Header text will be in Garamond font at a size 30, and will be in either the site's main green colour or the parchment beige, depending on if the user is in dark/light mode.



The products would be scrollable from left to right, offering a total of 10 products that cycle each week, with only the top 3 products of the week before remaining with a "spotlight" feature for those that the users like most.

This offers a level of user interactivity on a grand scale and allows for people to push the products and sellers they like to more people, sharing interests and building a unified community that rewards sellers on creating high-quality products that appeal to a large amount of people.

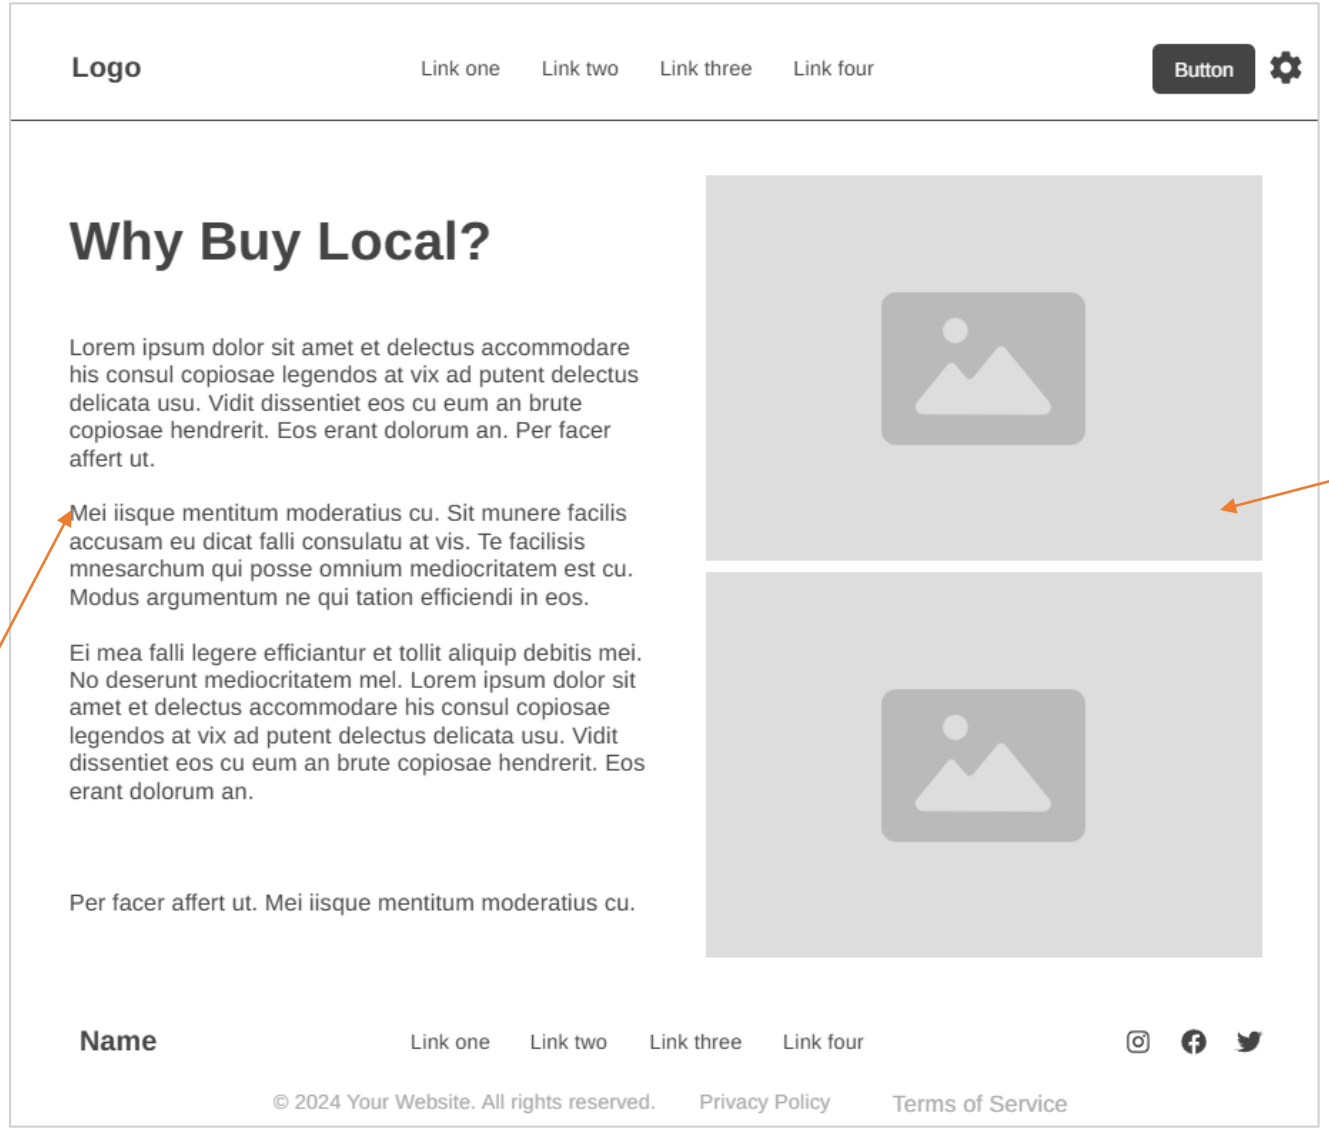
Wireframe – Why buy local?

Site Link

This is a static page, offering a more article-like blog on why the average person should support local produce. It can talk about environmental benefits, supporting payment for farmers, freshness compared to standard stores, etc.

This would be with an intent to educate someone who may not know the benefits, encouraging people to support a more ethical practice and healthier eating habits.

Body text will be in Tahoma at size 12-14, and Header text will be Garamond at a size of 30. The background will remain white or black depending on user choice, and header text will be either Green or Beige depending on light/dark mode selection respectively.



The images on the right will be (Placeholder) stock images of things like sheep or wheat fields, to show images of farmers or their livestock at work.

Eventually these could be replaced with images of partnered farmers who supply products, and these images could serve as links to their pages.

This would offer extra convenience and a clear way for the user to see the main goals of the company and how they work ethically for farmers and consumers alike.

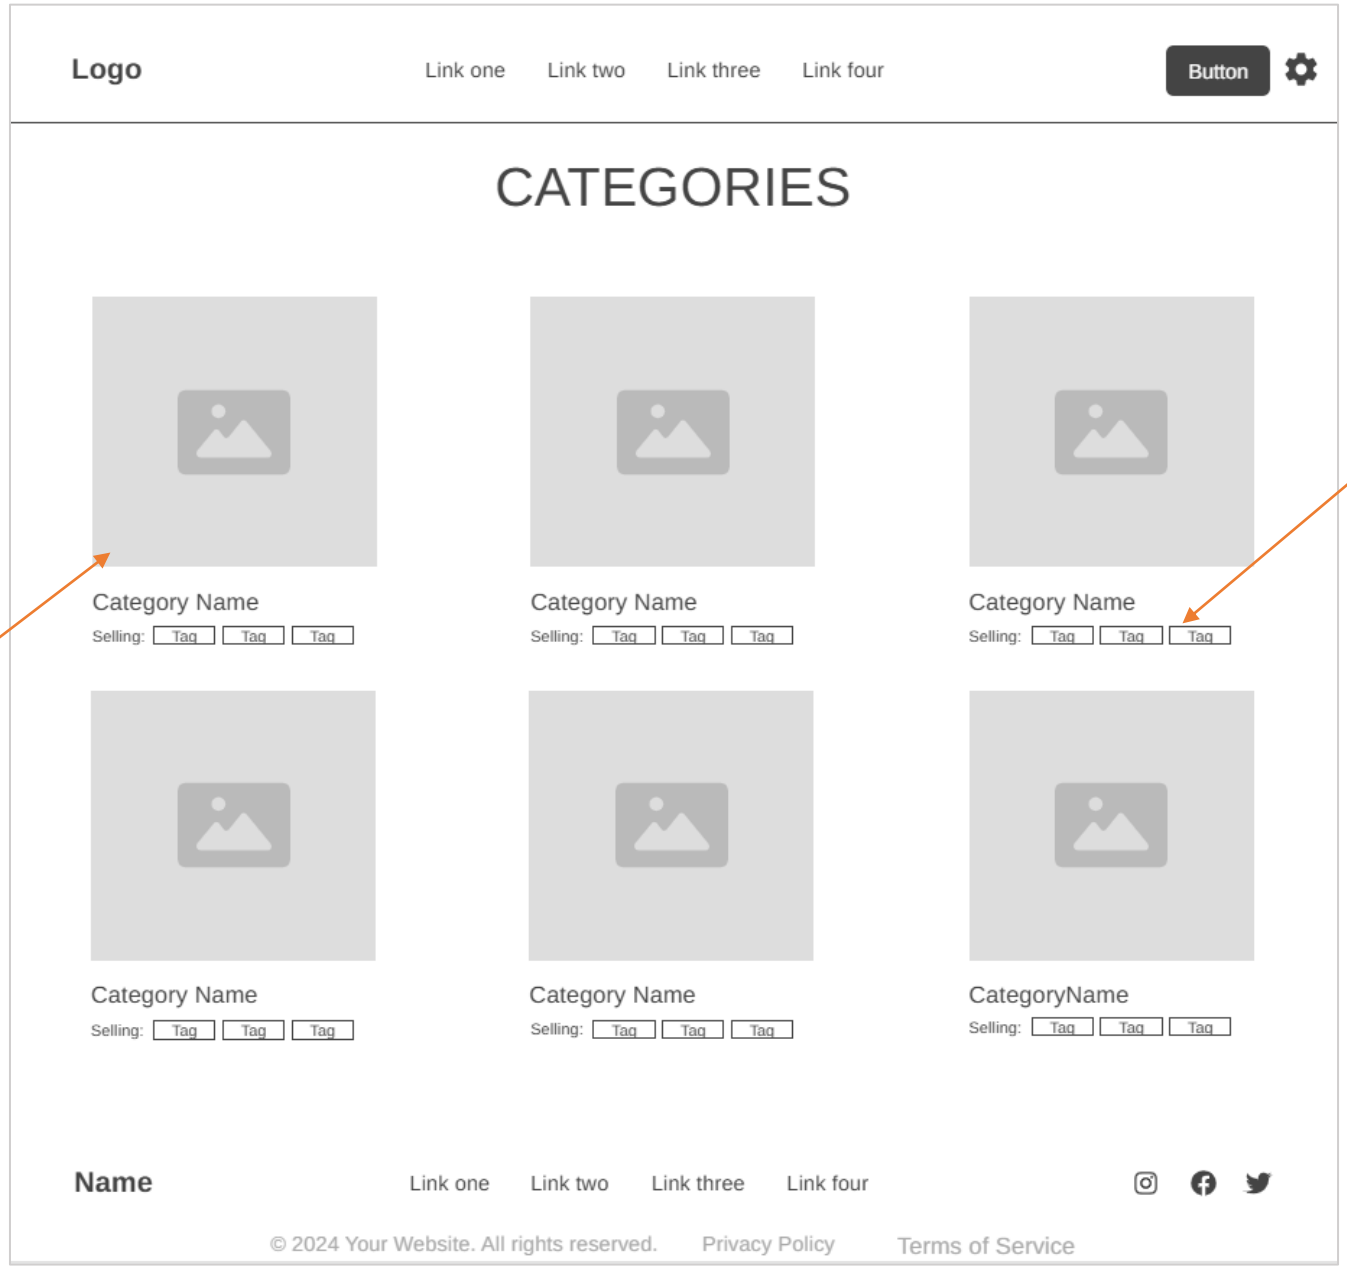
Wireframe – Product Categories

Site Link

For the categories page, I chose to centre the design around 6 major categories, like Dairy, Veg, Fruit, Meat/Proteins (to include eggs), Seeds, and Seafood. This offers a range of headings to categorise all products that could be sold locally. Things like Jams or spreads could be assigned under whichever ingredient is primarily used.

Some products may fall under multiple categories, which may allow them to show up twice, and so the categories are not a completely defining single-aspect term for a product.

Category name would be in Tahoma at a font size of 16, and the main header would follow normal header colour schemes in Garamond at a size 30.



Underneath the category names, I chose to use a tag-like system that shows the broad terms of what kinds of products will be sold there. For example, underneath dairy it may include “Cheeses, Yoghurts, Milks” and underneath fruits it may contain “Jams, Fresh Fruits, Cakes”.

This would give the user a quick display of what kinds of product they are likely to find in each section, giving them some direction if they’re looking for a given section, improving UX and search efficiency.

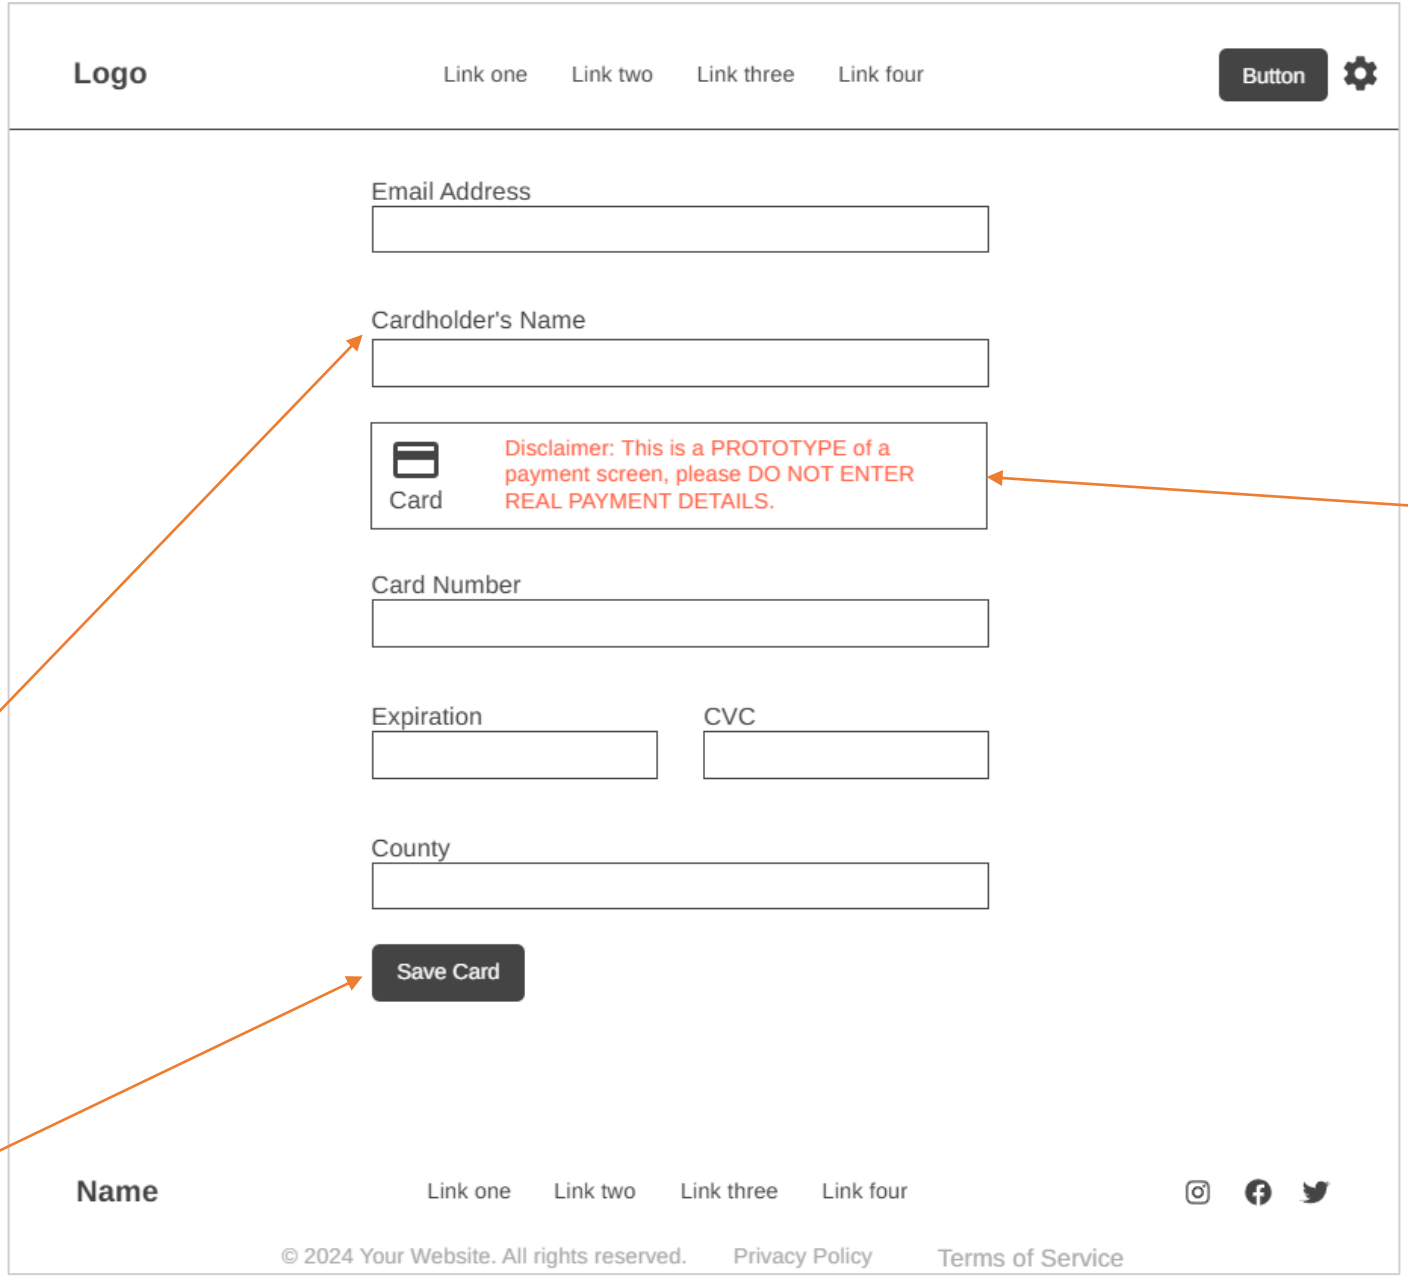
These tags would be in Tahoma at a font size of 12. Each box would be in the standard site green, and the text would be white or beige.

Wireframe – Order

Site Link

For the Order mockup screen, I went for a very generic order page with multiple clearly defined fields. Each of these would be validated to be filled in effectively with the expected criteria (e.g.: Card Number must be 16 integer digits.)

All text on this page will be either black or white, depending on the user's selection of light or dark mode. The font will be in Tahoma at a clearly visible font size of 16, though user input text will be in a standardised font such as Calibri or Aptos, to improve readability in such an important page.



Also on this page, I chose to include a warning to users that the payment screen included on my prototype is simply a mockup and not something that actual details should be inputted into. This is because site security and encryption will not be set up until it is ready to publish and so inputting data now can leave remnants of unsafe credit or debit card information in the database, potentially causing risk to that user. As such it is clearly highlighted in red that a user must not enter real payment details into the screen.

At the bottom, I have included a "Save Card" button. In the main implementation, a user's card details will be saved to their profile after their first order, but due to safety concerns that cannot be implemented yet. Text in here will also be in Tahoma (white) in font size 16, and the button will be Green.
